Dear recruiter:

Are you searching for a software engineer with a proven ability to develop web and mobile? If so, please consider me.

I started learning programming in 2011 and produced several course projects during my undergraduate years. At that time, I began interested in programming, impressed by the feeling of achievement after finishing a feature of the image processing application. So I decided to pursue a master degree in computer science. After nearly two-year learn and practice, I acquire more knowledge about computer science and how to develop applications, as well as some practical experience from a three-month internship, which are shown in my resume.

Known for these skills, I worked as software engineer intern in the HealthEngine LLC this summer. My work is to build a call center with real-time monitor recording hundreds of calls per day. It is a Ruby on Rails app deployed in AWS server. I also participated in ProveDB group of computing institute in the University of Chicago. I built and maintained the interface and documents of a graph Database based on WAMP server. Currently, I am looking for a software engineer job to involve in the real industry.

My technical ability includes cross-platform proficiency (Windows, Unix, Linux and Mac OS); fluency in Java, experience for iOS and Android development, knowledge about some scripting/programming languages (including Ruby, C++, Object c, PHP, html, CSS) and advanced knowledge of developer applications, tools, methodologies and best practices (including OOD and client/server architecture).

So if you are looking for a software engineer, please contact me. Thank you.

Sincerely,

Lingduo Kong
